

Daily Status Report - Tailoring Tourba Redesign

Date: April 22/23, 2026 Project: Kraftx / Tailoring Tourba B2B Manufacturing App Focus Areas: Customizer Stability, Aesthetic Overhauls (Products, Cart, Checkout), Pricing Logic.

1. Customizer Module Stabilization (/customizer)

- Drag & Drop Jitters Fixed: Resolved the severe "shaking" and "infinite loop" issues in the T-Shirt customizer. Swapped continuous `onDrag` state updates for `onDragStop` event handlers, and implemented GPU-accelerated rasterization (`will-change: transform`).
- Upload Robustness: Addressed the "infinite loading" bug during logo uploads by creating a reliable mock-fallback for Cloudinary configurations that prevents the UI from freezing.
- Cart Flow Redirection: Implemented a smooth post-customization workflow. After adding a design to the cart, the system now automatically redirects the user to the `/products` catalog to encourage continued shopping.

2. Global Aesthetic Overhaul (Editorial & Luxury)

We transitioned the app away from a generic, tech-focused e-commerce template to a premium, editorial B2B manufacturing aesthetic matching the landing page.

- Typography: Replaced the generic `Outfit` fonts with the elegant `Playfair Display` serif font for all major headings.
- Color Palette: Standardized the use of `tth-white`, `tth-gold`, `tth-olive`, and `tth-beige` across the platform.
- UI Components: Removed harsh gray square borders in favor of sophisticated `glass-card` styling with soft inner shadows, subtle zoom hover states, and dynamic micro-animations.

3. Products Catalog Redesign (/products)

- Hero Section Integration: Rebuilt the catalog header to feature an HD background image of a tailoring/manufacturing facility.
- Overlay Adjustments: Perfected the frosted glass overlay and added soft `text-shadow` glows to ensure the dark luxury typography remains highly legible against the busy HD background.

4. Cart & Checkout Redesign (/cart & /checkout)

- Pricing Logic Fixed: Identified and patched a critical bug in the pricing engine. The previous logic (`parseInt`) discarded cents, converting "199.99" to "199". The new engine uses `parseFloat` and precise regex to guarantee pixel-perfect decimal calculations across the platform.
 - Cart Makeover: Completely overhauled the Cart view. Items now sit in beautiful glass-cards. The "No Image" fallback is now an elegant beige textured block with a minimalist icon.
 - Checkout Redesign: Replaced all hardcoded, legacy inline styles in the `/checkout` page with a dedicated CSS module. Added the sophisticated `tth-gold` submit buttons and redesigned the "Order Confirmed" success state to match the premium luxury feel.
-

Next Steps for Future Sessions

1. Customizer Boundaries: Implement strict dragging boundaries to prevent logos from being dragged off the edges of the shirt.
2. Product Quick-Views: Add dynamic modal windows or side-panels to view product details directly from the catalog.
3. Production Variables: Finalize and test the real Cloudinary API keys for the production deployment.
